ON

Type of Designation: Vodafone 1231 Manufacturer:

Type of Equipment: Windows Mobile Smart Phone ZTE CORPORATION

ACCORDING TO

FCC Part 2.1093: Radiofrequency radiation exposure evaluation: portable devices, e-CFR March 23, 2006

FCC OET Bulletin 65 Supplement C (Edition 01-01): Additional Information for Evaluating Compliance of Mobile and Portable Devices with FCC Limits for Human Exposure to Radiofrequency Emissions

IEEE Std 1528[™]-2003: IEEE Recommended Practice for Determining the Peak Spatial-Average Specific Absorption Rate (SAR) in the Human Head from Wireless Communications **Devices: Measurement Techniques**

China Telecommunication Technology Labs.

Month date, year Dec 8, 2008

Signature

He Guili Director

FCC ID: Report Date: Q78-VDF1231 2008-11-20

Test Firm Name: Registration Number: China Telecommunication Technology Labs 840587

Statement

The measurements shown in this report were made in accordance with the procedures described on test pages. All reported tests were carried out on a sample equipment to demonstrate limited compliance with FCC CFR 47 Part 2.1093. The sample tested was found to comply with the requirements defined in the applied rules.

1. General Information

1.1 Notes

All reported tests were carried out on a sample equipment to demonstrate limited compliance with the requirements of FCC CFR 47 Part 2.1093.

The test results of this test report relate exclusively to the item(s) tested as specified in section 2.

The following deviations from, additions to, or exclusions from the test specifications have been made. See Annex D.

China Telecommunication Technology Labs.(CTTL) authorizes the applicant or manufacturer (see section 1.4) to reproduce this report provided, and the test report may only be reproduced or published in full. Reproduction or publication of extracts from the report requires the prior written approval of CTTL Mr. He Guili.

Any use which a third party makes of this report, or any reliance on or decisions to be made based on it, are the responsibility of such third parties. CTTL accepts no responsibility for damages, if any, suffered by any third party as a result of decisions made or actions based on this report.

3 Measurement Systems

3.1 SAR Measurement Systems Setup

All measurements were performed using the automated near-field scanning system, DASY4, from Schmid & Partner Engineering AG (SPEAG). The system is based on a high precision industrial robot which positions the probes with a positional repeatability of better than 0.02mm. Special E- and H-field probes have been developed for measurements close to material discontinuity, the sensors of which are directly loaded with a Schottky diode and connected via highly resistive lines (length = 300mm) to the data acquisition unit.

A cell controller system containing the power supply, robot controller, teach pendant (Joystick) and remote control, is used to drive the robot motors. The PC consists of the Micron Pentium III 800 MHz computer with Windows 2000 system and SAR Measurement Software DASY4, A/D interface card, monitor, mouse, and keyboard. The Stäubli Robot is connected to the cell controller to allow software manipulation of the robot. A data acquisition electronic (DAE) performs the signal amplification, signal multiplexing, AD-conversion, offset measurements, mechanical surface detection, collision detection, etc., which is connected to the Electro-optical coupler (EOC). The EOC performs the conversion from the optical signal to digital electric signal of the DAE and transfers data to the PC plug-in card.

Demonstration of measurement system setup

The DAE4 consists of a highly sensitive electrometer-grade preamplifier with auto-zeroing, a channel and gain-switching multiplexer, a fast 16 bit AD-converter

Address: 11 YUE TAN NAN JIE, BEIJING, P.R.C, 100045 Tel: +86 10 68094053 FAX: +86 10 68011404 Web: http://www.chinattl.com

and a command decoder and control logic unit. Transmission to the PC-card is accomplished through an optical downlink for data and status information and an optical uplink for commands and clock lines. The mechanical probe mounting device includes two different sensor systems for frontal and sidewise probe contacts. They are also used for mechanical surface detection and probe collision detection. The robot uses its own controller with a built-in VME-bus computer.

3.2 E-field Probe

3.2.1 E-field Probe Description

The SAR measurements were conducted with the dosimetric probe ES3DV3 (manufactured by SPEAG), designed in the classical triangular configuration and optimized for dosimetric evaluation. The probe has been calibrated according to the standard procedure with an accuracy of better than $\pm 10\%$. The spherical isotropy was evaluated and found to be better than ± 0.25 dB.

Items	Specification		
	Symmetrical design with triangular core		
Construction	Built-in optical fiber for surface detection System		
	Built-in shielding against static charges		
	PEEK enclosure material (resistant to		
	organic solvents, e.g., glycol)		
	In air from 10 MHz to 2.5 GHz		
	In brain and muscle simulating tissue at		
Calibration	frequencies of 450MHz, 900MHz and 1.8GHz		
Calibration	(accuracy±8%)		
	Calibration for other liquids and frequencies		
	upon request		
Frequency	I 0 MHz to > 6 GHz; Linearity: ±0.2 dB		
Trequency	(30 MHz to 3 GHz)		
Directivity	±0.2 dB in brain tissue (rotation around probe axis)		
Directivity	±0.4 dB in brain tissue (rotation normal probe axis)		
Dynamic Range	5u W/g to > 100mW/g; Linearity: ±0.2dB		
Surface Detection	±0.2 mm repeatability in air and clear liquids		
Surface Detection	over diffuse reflecting surface(ET3DV6 only)		
	Overall length: 330mm		
	Tip length: 16mm		
Dimensions	Body diameter: 12mm		
	Tip diameter: 6.8mm		
	Distance from probe tip to dipole centers: 2.7mm		
	General dosimetry up to 3GHz		
Application	Compliance tests of mobile phones		
	Fast automatic scanning in arbitrary phantoms		

3.2.2 E-field Probe Calibration

The Annex C is the copy of the calibration certificate of the used probes. Each probe is calibrated according to a dosimetric assessment procedure with accuracy better than \pm 10%. The spherical isotropy was evaluated and found to be better than \pm 0.25dB. The sensitivity parameters (NormX, NormY, NormZ), the diode compression parameter (DCP) and the conversion factor (ConvF) of the probe are tested.

The free space E-field from amplified probe outputs is determined in a test chamber. This is performed in a TEM cell for frequencies bellow 1 GHz, and in a wave guide above 1 GHz for free space. For the free space calibration, the probe is placed in the volumetric center of the cavity and at the proper orientation with the field. The probe is then rotated 360 degrees.

E-field temperature correlation calibration is performed in a flat phantom filled with the appropriate simulated brain tissue. The free-space E-field measured in the medium correlates to temperature increase in a dielectric medium. For temperature correlation calibration a RF transparent thermistor-based temperature probe is used in conjunction with the E-field probe.

$$\mathbf{SAR} = \mathbf{C} \frac{\Delta T}{\Delta t}$$

Where: $\Delta t = Exposure time (30 seconds)$,

C = Heat capacity of tissue (brain or muscle), ΔT = Temperature increase due to RF exposure. Or

$$\mathbf{SAR} = \frac{|\mathbf{E}|^{1} \sigma}{\rho}$$

Where:

 σ = Simulated tissue conductivity,

 ρ = Tissue density (kg/m³).

3.3 Phantom

The Generic Twin Phantom is constructed of a fiberglass shell integrated in a wooden table. The shape of the shell is based on data from an anatomical study designed to determine the maximum exposure in at least 90% of all users. It enables the dosimetric evaluation of left and right hand phone usage as well as body mounted usage at the flat phantom region. A cover prevents the evaporation of the liquid. Reference markings on the Phantom allow the complete setup of all predefined phantom positions and measurement grids by manually teaching three points in the robot.

Specifications: Shell Thickness: 2±0.1mm Filling Volume: Approx. 20 liters Dimensions: 810 x 1000 x 500 mm (H x L x W) Liquid depth when testing: at least 150 mm

3.4 Device Holder

In combination with the Generic Twin Phantom V3.0, the Mounting Device (POM) enables the rotation of the mounted transmitter in spherical coordinates whereby the rotation points is the ear opening. The devices can be easily, accurately, and repeat ably positioned according to the FCC and CENELEC specifications. The device holder can be locked at different phantom locations (left head, right head, flat phantom etc).

Specific Absorption Rate (SAR) (1g)	1.007 Kg	

4.4 Test Results

The EUT complies.

Note:

All measurements are traceable to national standards.

4.5 Test Setup and Procedures

The test setup is showed as picture 1 in the annex A.

The evaluation was performed according to the following procedure:

Step 1: The SAR value at a fixed location above the ear point was measured and was used as a reference value for assessing the power drift.

Step 2: The SAR distribution at the exposed side of the head was measured at a distance of 4 mm from the inner surface of the shell. The area covered the entire dimension of the head and the horizontal grid spacing was 10 mm x 10 mm. Based on these data, the area of the maximum absorption was determined by interpolation.

Step 3: Around this point, a volume of 30 mm x 30 mm x 25 mm was assessed by measuring 7 x 7 x 6 points. On this basis of this data set, the spatial peak SAR value was evaluated with the following procedure:

a. The data at the surface were extrapolated, since the center of the dipoles is 2.7 mm away from the tip of the probe and the distance between the surface and the lowest measuring point is 1.2 mm. The extrapolation was based on the least square algorithm. A polynomial of the fourth order was calculated through the points in z-axes. This polynomial was then used to evaluate the points between the surface and the probe tip.

b. The maximum interpolated value was searched with a straightforward algorithm. Around this maximum the SAR values averaged over the spatial volumes (1g or 10g) were computed using the 3D-Spline interpolation algorithm. The 3D-spline is composed of three one-dimensional splines with the "Not a knot"-condition (in $x \sim y$ and z-directions). The volume was integrated with the trapezoidal algorithm. One thousand points (10 x 10 x 10) were interpolated to calculate the average.

c. All neighboring volumes were evaluated until no neighboring volume with a higher average value was found.

Step 4: Re-measurement the SAR value at the same location as in Step 1. If the value changed by more than 5%, the evaluation should be repeated.

4.6 Test Environment and Liquid Parameters

4.7 System Validation Check

Validation Method:

The setup of system validation check or performance check is demonstrated as figure 5. The amplifier, low pass filter and attenuators are optional. The dipole shall be positioned and centered below the phantom, paralleling to the longest side of the phantom. A low loss and low dielectric constant spacer on the dipole may be used to guarantee the correct distance between the dipole top surface and the phantom bottom surface.

The separation d, which is defined as the distance from the liquid bottom surface to the dipole's central axis at location of the feed-point, should be as following: for 835 MHz dipole, d = 15 mm, and for 1900 MHz dipole, d = 10 mm, and this can be obtained using two different size spacer. The dipole arms shall be parallel to the flat phantom surface.

First the power meter PM1 is connected to the cable and it measures the forward Address: 11 YUE TAN NAN JIE, BEIJING, P.R.C, 100045 Tel: +86 10 68094053 FAX: +86 10 68011404 Web: http://www.chinattl.com

power at the location of the dipole connector (X). The signal generator is adjusted for the desired forward power at the dipole connector (taking into account the (Att1) value) and the power meter PM2 is read at that level. Then after connecting the cable to the dipole, the signal generator is readjusted for the same reading at the power meter PM2.

The system validation check procedures are the same as all measurement procedures used for compliance tests. A complete 1 g averaged SAR measurement is performed using the flat part of the phantom. The reference dipole input power is adjusted to produce a 1 g averaged SAR value falling in the range of 0.4 - 10 mW/g. The 1 g averaged SAR is measured at 835 MHz and 1900 MHz using corresponding dipole respectively. Then the results are normalized to 1 W forward input power and compared with the reference SAR values.

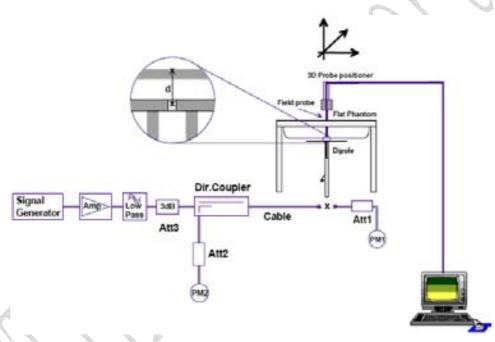

Figure 5 Illustration of system validation test setup

Validation Results

	Ticcuo	Input	Targeted	Measured	Deviation
Date:	Tissue	Power	SAR _{1g}	SAR _{1g}	(%)
		(mW)	(mW/g)	(mW/g)	(<±10%)
2008-11-17	1900MHz Head	250	10.2	10.10	-0.98
2008-11-18	1900MHz Body	250	10.3	9.77	-5.15

4.8 Maximum Output Power Measurement

According to FCC OET 65c, maximum output power shall be measured before and after each SAR test. The test setup and method are described as following.

Test setup

The output power measurement test setup is demonstrated as figure 6.

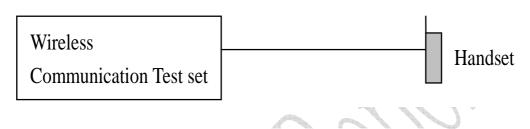

Figure 6 Demonstration of power measurement

The power control level settings and measurement value are as following table.

mode	PCL setting	Permissible max.values	Channel[low] 1850.2 MHz	Channel[mid] 1880.0 MHz	Channel[high] 1909.8 MHz
GSM 1900	0	30dBm	28.85dBm	28.94dBm	29.65dBm
GPRS 1900	0	30dBm	29.86 dBm	29.47 dBm	29.79 dBm
EGPRS 1900	0	30dBm	26.58 dBm	28.32 dBm	27.57 dBm

4.9 Test Data

4.9.1 Test Specifications

(a) Duty Factor and Crest Factor

For GSM mode, the duty factor is 1:8.3 and the crest factor is 8.3.

For GPRS and EGPRS mode, the duty factor is 1:4.15 and the crest factor is 4.15.

(b) Test configurations pictures:

Configurations	pictures no. in Annex A

Liquid depth for 1900 band	10	

(c) Test description for body-worn mode

The distance between the handset and the bottom of the flat section is 15 mm.

(d) Liquid recipe		
INGREDIENTS	SIMULATING TI	SSUE
Water	1900MHz Brain	1900MHz Muscle
DGBE	55.24	70.17
Sugar	44.45	29.44
Salt	0	0
Cellulose	0.31	0.39
Preventol	0	0
Water	0	0

(e) Test procedure for body-worn mode

Step 1: GSM1900 band, test the middle channel of each of the front side and back side mode with the 15 mm distance between the handset and the bottom of the phantom, including slip open and close. Find out the worst case.

Step 2: For the worst case of step 1, test the low and high channel.

Step 3: Find out the worst case of step 1 and 2, and for this case, test the mode with Bluetooth on, and then with earphone using voice traffic mode.

Step 4: Repeat all the above steps for other modes.

ANNEX B Graphical Results

B.1 GSM1900, low channel of left tilt configuration

Date: 2008-11-17

Communication System: PCS 1900; Frequency: 1850.2 MHz; Duty Cycle: 1:8.3 Medium parameters used (interpolated): f = 1850.2 MHz; σ = 1.3 mho/m; ϵ r = 40.9; ρ = 1000 kg/m3 Phantom section: Left Section Measurement Standard: DASY5 (IEEE/IEC)

DASY4 Configuration:

- Probe: ES3DV3 SN3158; ConvF(4.83, 4.83, 4.83); Calibrated: 4/7/2008
- Sensor-Surface: 4mm (Mechanical Surface Detection)
- Electronics: DAE4 Sn797; Calibrated: 2/19/2008
- Phantom: Twin SAM; Type: SAM; Serial: TP-1472
- Measurement SW: DASY5, V5.0 Build 119; SEMCAD X Version 13.2 Build 87

Tilt position - Low/Zoom Scan (7x7x7) (7x7x7)/Cube 0: Measurement

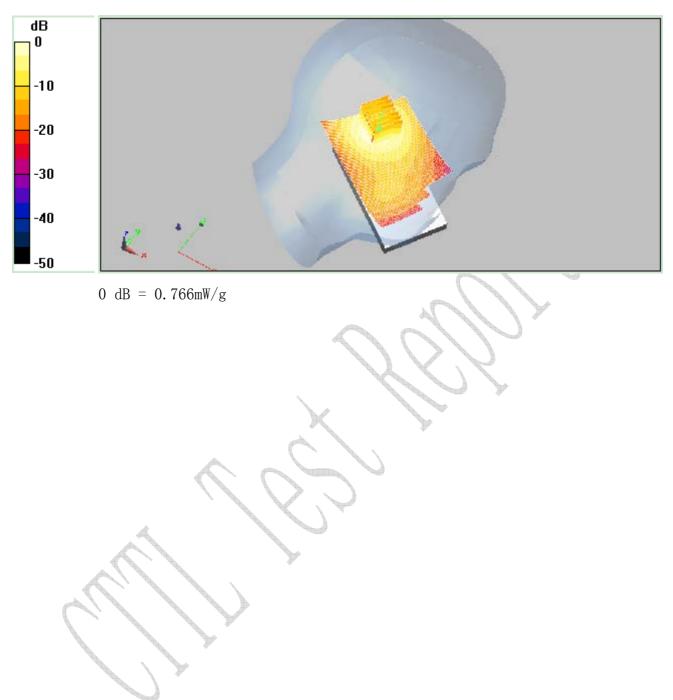

grid: dx=5mm, dy=5mm, dz=5mm Reference Value = 17.4 V/m; Power Drift = 0.035 dB Peak SAR (extrapolated) = 1.21 W/kg SAR(1 g) = 0.678 mW/g; SAR(10 g) = 0.377 mW/g

Info: Interpolated medium parameters used for SAR evaluation. Maximum value of SAR (measured) = 0.754 mW/g

Tilt position - Low/Area Scan (61x91x1): Measurement grid: dx=15mm, dy=15mm

Info: Interpolated medium parameters used for SAR evaluation. Maximum value of SAR (interpolated) = 0.766 mW/g

B.2 GPRS1900, high channel of Back body configuration

Date: 2008-11-18

Communication System: PCS 1900; Frequency: 1909.8 MHz; Duty Cycle: 1:4.15 Medium parameters used (interpolated): f = 1909.8 MHz; σ = 1.46 mho/m; ϵ r = 53.4; ρ = 1000 kg/m3 Phantom section: Flat Section Measurement Standard: DASY5 (IEEE/IEC)

DASY4 Configuration:

- Probe: ES3DV3 SN3158; ConvF(4.7, 4.7, 4.7); Calibrated: 4/7/2008
- Sensor-Surface: 3.4mm (Mechanical Surface Detection)
- Electronics: DAE4 Sn797; Calibrated: 2/19/2008
- Phantom: ELI 4.0; Type: QDOVA001BA; Serial: xxxx
- Measurement SW: DASY5, V5.0 Build 119; SEMCAD X Version 13.2 Build 87

GPRS Back High/Area Scan (61x91x1): Measurement grid: dx=15mm, dy=15mm

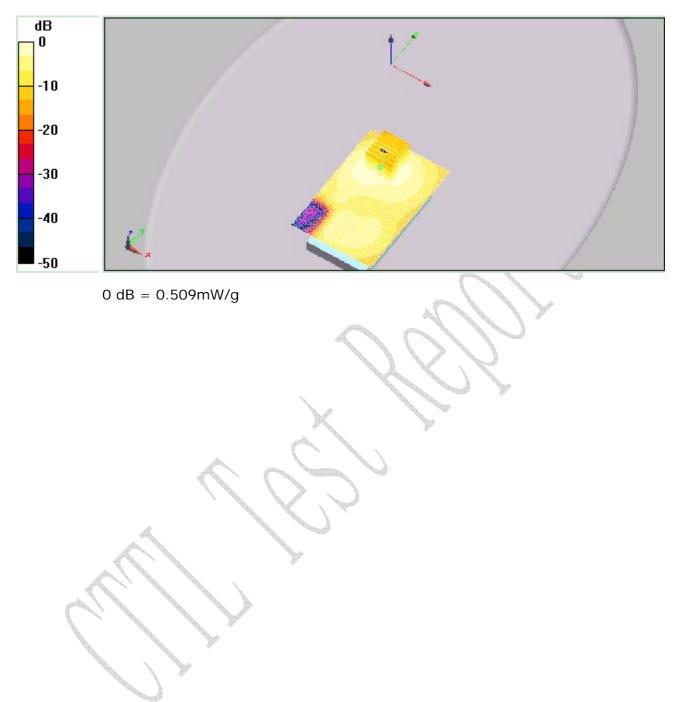

Info: Interpolated medium parameters used for SAR evaluation. Maximum value of SAR (interpolated) = 0.521 mW/g

GPRS Back High/Zoom Scan (7x7x7) (7x7x7)/Cube 0: Measurement grid: dx=5mm, dy=5mm, dz=5mm Reference Value = 14.7 V/m; Power Drift = 0.068 dB Peak SAR (extrapolated) = 0.717 W/kg SAR(1 g) = 0.441 mW/g; SAR(10 g) = 0.262 mW/g

Info: Interpolated medium parameters used for SAR evaluation.

Warning: Maximum averaged SAR over 10 g is located on the boundary of the measurement cube. This cube might not incorporate the absolute averaged SAR. Please consider a refinement of the Area Scan measurement. Maximum value of SAR (measured) = 0.509 mW/g

B.3 EGPRS1900, high channel of back body configuration

Date: 2008-11-18

Communication System: PCS 1900; Frequency: 1909.8 MHz; Duty Cycle: 1:4.15 Medium parameters used (interpolated): f = 1909.8 MHz; $\sigma = 1.46$ mho/m; $\epsilon r = 53.4$; $\rho = 1000$ kg/m3 Phantom section: Flat Section Measurement Standard: DASY5 (IEEE/IEC)

DASY4 Configuration:

- Probe: ES3DV3 SN3158; ConvF(4.7, 4.7, 4.7); Calibrated: 4/7/2008
- Sensor-Surface: 3.4mm (Mechanical Surface Detection)
- Electronics: DAE4 Sn797; Calibrated: 2/19/2008
- Phantom: ELI 4.0; Type: QDOVA001BA; Serial: xxxx
- Measurement SW: DASY5, V5.0 Build 119; SEMCAD X Version 13.2 Build 87

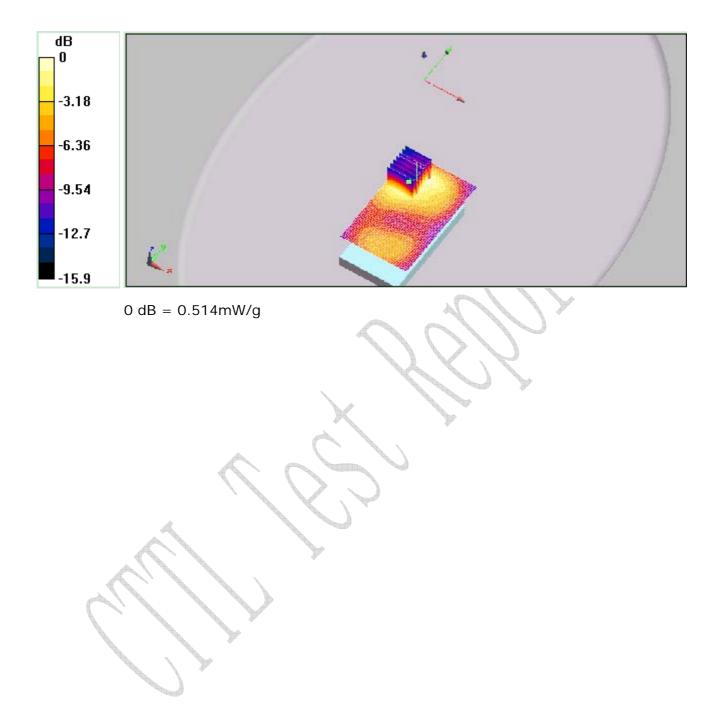

EGPRS Back High/Area Scan (51x81x1): Measurement grid: dx=15mm, dy=15mm

Info: Interpolated medium parameters used for SAR evaluation. Maximum value of SAR (interpolated) = 0.517 mW/g

EGPRS Back High/Zoom Scan (7x7x7) (7x7x7)/Cube 0: Measurement grid: dx=5mm, dy=5mm, dz=5mm Reference Value = 14.9 V/m; Power Drift = -0.060 dB Peak SAR (extrapolated) = 0.719 W/kg SAR(1 g) = 0.445 mW/g; SAR(10 g) = 0.265 mW/g

Info: Interpolated medium parameters used for SAR evaluation. Maximum value of SAR (measured) = 0.514 mW/g

B.4 GSM1900, low channel of back body with earphone configuration

Date: 2008-11-18

Communication System: PCS 1900; Frequency: 1850.2 MHz; Duty Cycle: 1:8.3 Medium parameters used (interpolated): f = 1850.2 MHz; σ = 1.39 mho/m; ϵ r = 53.6; ρ = 1000 kg/m3 Phantom section: Flat Section Measurement Standard: DASY5 (IEEE/IEC)

DASY4 Configuration:

- Probe: ES3DV3 SN3158; ConvF(4.91, 4.91, 4.91); Calibrated: 4/7/2008
- Sensor-Surface: 3.4mm (Mechanical Surface Detection)
- Electronics: DAE4 Sn797; Calibrated: 2/19/2008
- Phantom: ELI 4.0; Type: QDOVA001BA; Serial: xxxx
- Measurement SW: DASY5, V5.0 Build 119; SEMCAD X Version 13.2 Build 87

Earphopne Back Low/Area Scan (81x111x1): Measurement grid: dx=15mm, dy=15mm

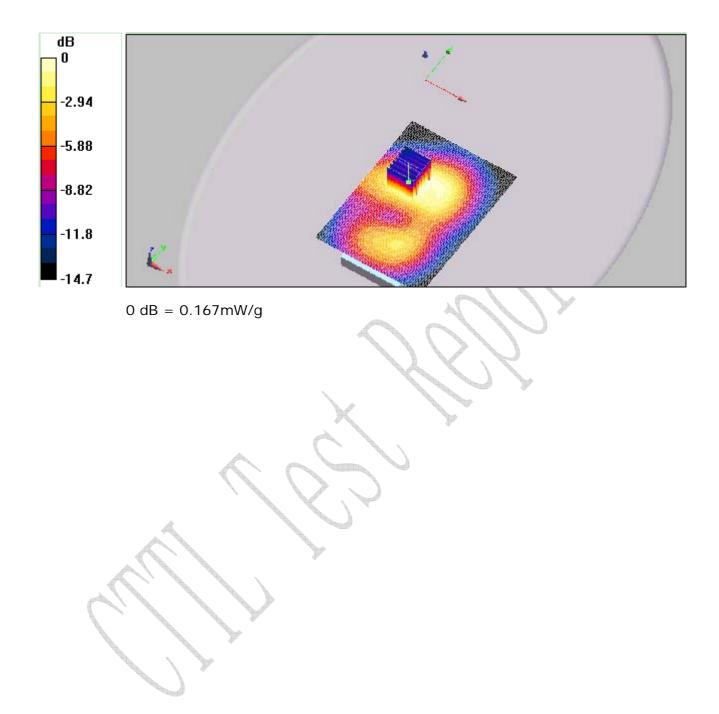

Info: Interpolated medium parameters used for SAR evaluation. Maximum value of SAR (interpolated) = 0.163 mW/g

Earphopne Back Low/Zoom Scan (7x7x7) (7x7x7)/Cube 0: Measurement grid: dx=5mm, dy=5mm, dz=5mm Reference Value = 9.98 V/m; Power Drift = 0.025 dB Peak SAR (extrapolated) = 0.233 W/kg SAR(1 g) = 0.146 mW/g; SAR(10 g) = 0.090 mW/g

Info: Interpolated medium parameters used for SAR evaluation. Maximum value of SAR (measured) = 0.167 mW/g

Annex C System Performance Check Graphical Results

C.1 SystemPerformanceCheck-head-D1900MHz

Date: 2008-11-17

DUT: Dipole 1950 MHz; Type: D1950V2; Serial: D1950V2 - SN:xxx

Communication System: CW; Frequency: 1950 MHz; Duty Cycle: 1:1 Medium parameters used: f = 1950 MHz; $\sigma = 1.4$ mho/m; $\epsilon r = 40.5$; $\rho = 1000$ kg/m3 Phantom section: Flat Section Measurement Standard: DASY5 (IEEE/IEC)

DASY4 Configuration:

- Probe: ES3DV3 SN3158; ConvF(4.83, 4.83, 4.83); Calibrated: 4/7/2008
- Sensor-Surface: 3.4mm (Mechanical Surface Detection)

ES3DV3 SN:3158

April 7, 2008

Probe ES3DV3

SN:3158

Manufactured: Calibrated: August 13, 2007 April 7, 2008

Calibrated for DASY Systems (Note: non-compatible with DASY2 system!)

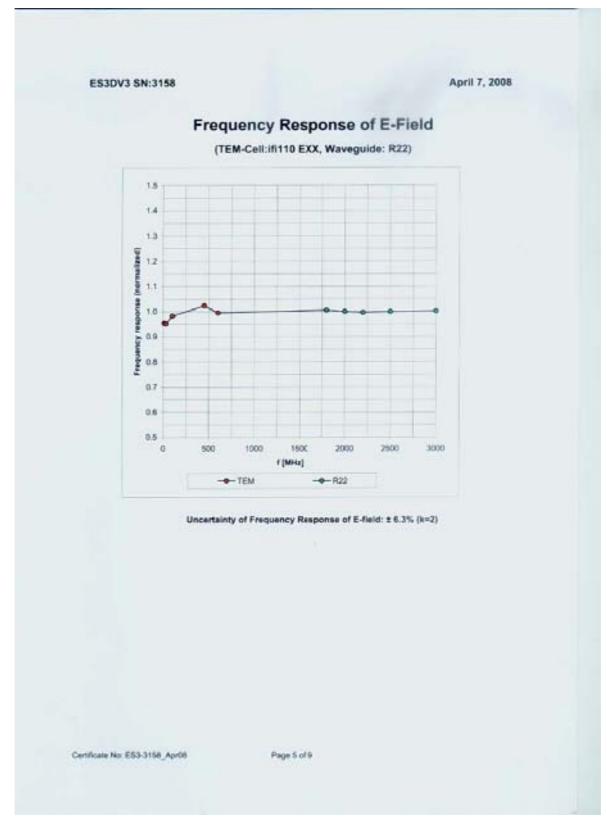

Certificate No: ES3-3158_Apr08

Page 3 of 9

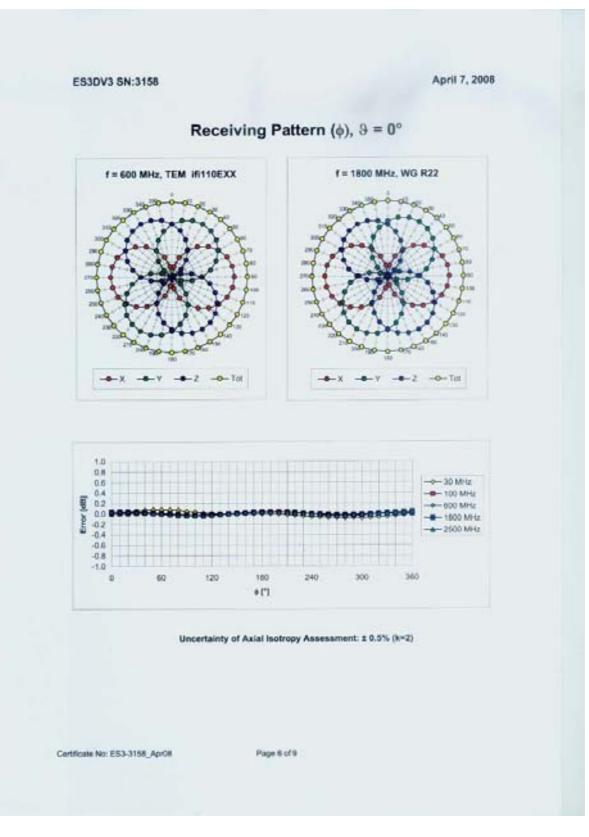

E83DV3 SN:3158			April 7, 2008		
DASY - Par	rameters of	Probe: ES3	DV3 SN	3158	
Sensitivity in Free Space ^A			Diode Compression ⁶		
	AND THE REAL PROPERTY OF	μV/(V/m) ²	DCP X	97 mV	
NormX	1.11 ± 10.1% 1.20 ± 10.1%	2 - 2 - 2 - 2 - 2 - 2 - 2 - 2 - 2 - 2 -	DCP X	91 mV	
NormY		μV/(V/m) ²	DCP Z	93 mV	
Saneitivity in Ti	ssue Simulating	Liquid (Conver	sion Factor	a)	
Please see Page 8.	soue ontrolating	Eidnig (opriver	aonrusio	-7	
riese see raye o.					
Boundary Effec	st				
TSL	900 MHz Typical	SAR gradient: 5 %	per mm		
Sensor Cent	ter to Phantom Surface	Distance	3.0 mm	4.0 mm	
SAR ₆₄ [%]	Without Correction		9.2	5.2	
SAR _{te} (%)	With Correction A	Igorithm	0.8	0.7	
TSL 1	1810 MHz Typical	SAR gradient: 10 %	per mm		
Sensor Cent	ter to Phantom Surface	Distance	3.0 mm	4.0 mm	
SAR _{te} (%)	Without Correction	n Algorithm	10.8	6.0	
SAR _{te} [%]	With Correction A	lgorithm	0.8	0.7	
Sensor Offset					
Probe Tip to	Sensor Center		2.0 mm		
The reported unco	ertainty of measure	ment is stated as	the standard	uncertainty of	
	tiplied by the cover coverage probabilit			mal distribution	
	and the second second	en e			
	xX,Y,Z do not affect the E ² -fe arameter: uncertainty not rec		(see Page 8)		
ficate No: ES3-5158_A	φr08	Page 4 of 9			

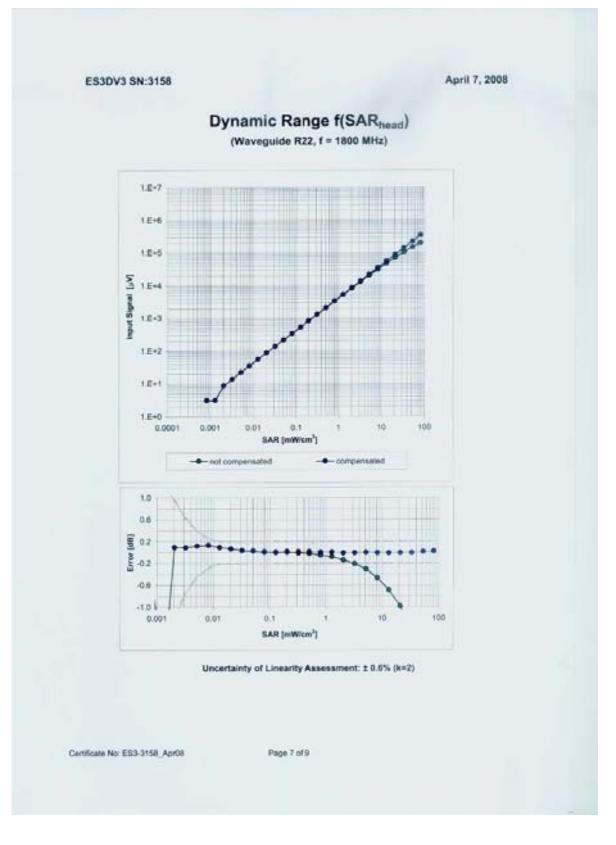

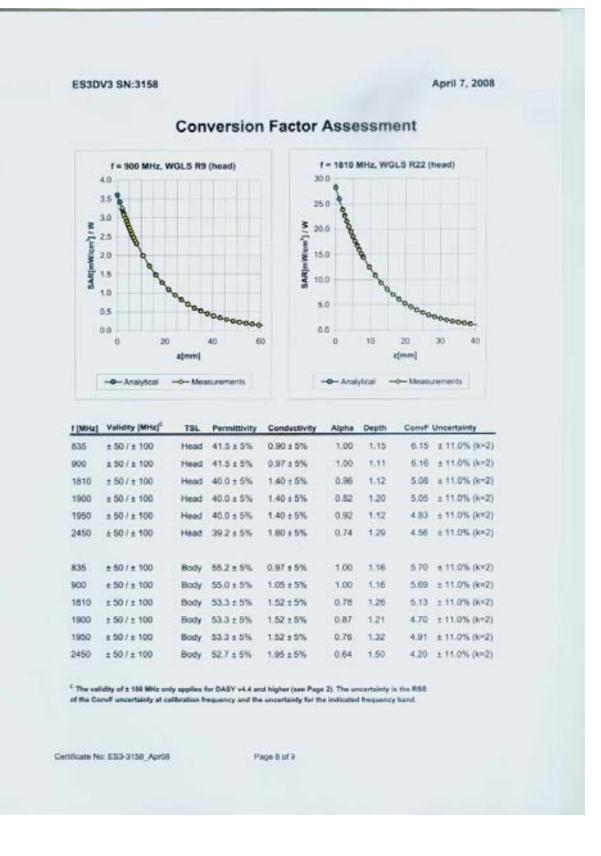

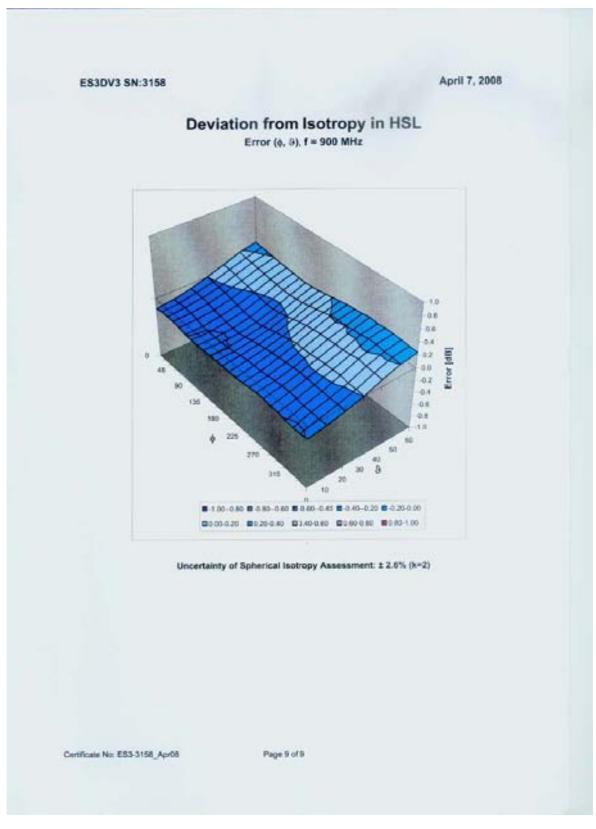

ANNEX E Deviations from Prescribed Test Methods

No deviation from Prescribed Test Methods.
